Experiment 05

Aim

To perform **task analysis** for an e-commerce application and design a **user flow diagram** that represents the steps a user follows while purchasing a product online.

Task Analysis

Task Analysis is the process of breaking down user interactions into smaller steps to understand how users complete a specific goal.

In this experiment, the goal of the user is to successfully **purchase a product through an e-commerce application**.

This task analysis helps to:

- Understand user actions during online shopping.
- Identify decision points such as login and payment method.
- Improve the efficiency of the purchasing process.
- Reduce user confusion during checkout.

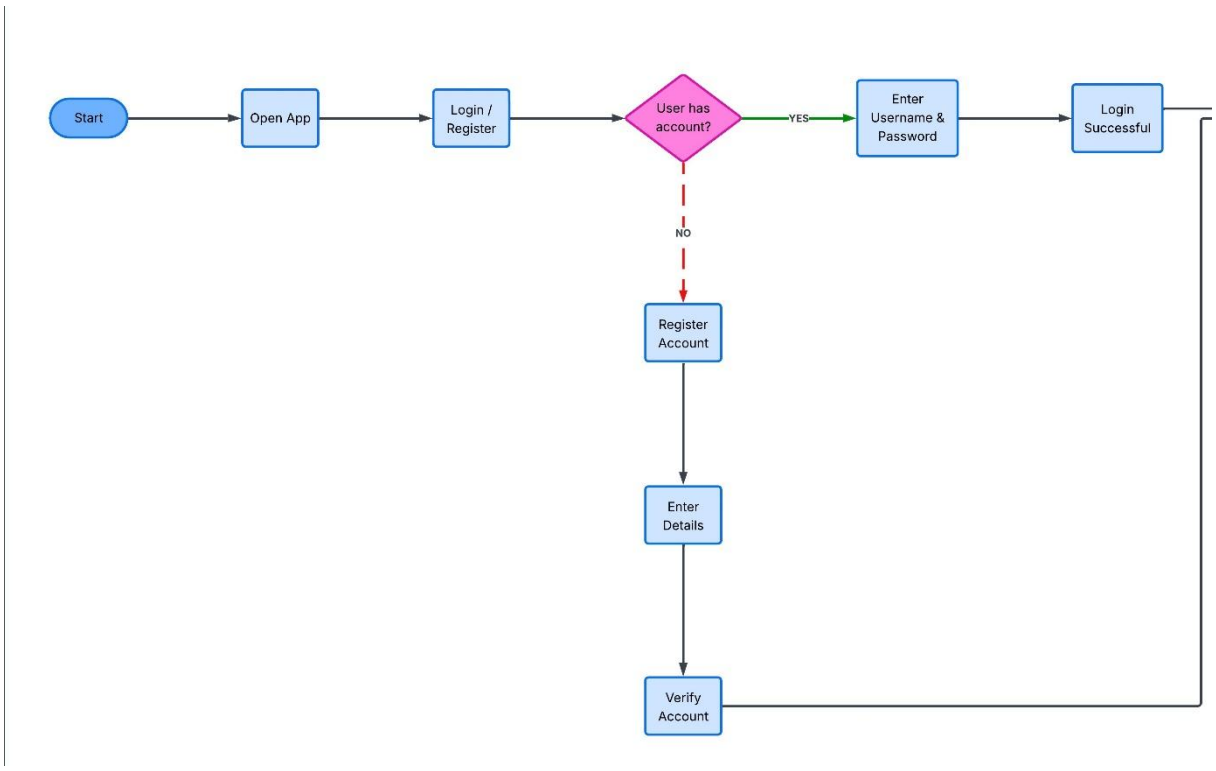
Key Aspects of Task Analysis

- Identifying user goal – Purchasing a product online.
- Understanding the sequence of actions from opening the app to order confirmation.
- Recognizing decision points (Login/Register, Payment Method).
- Ensuring smooth navigation between steps.

User Flow

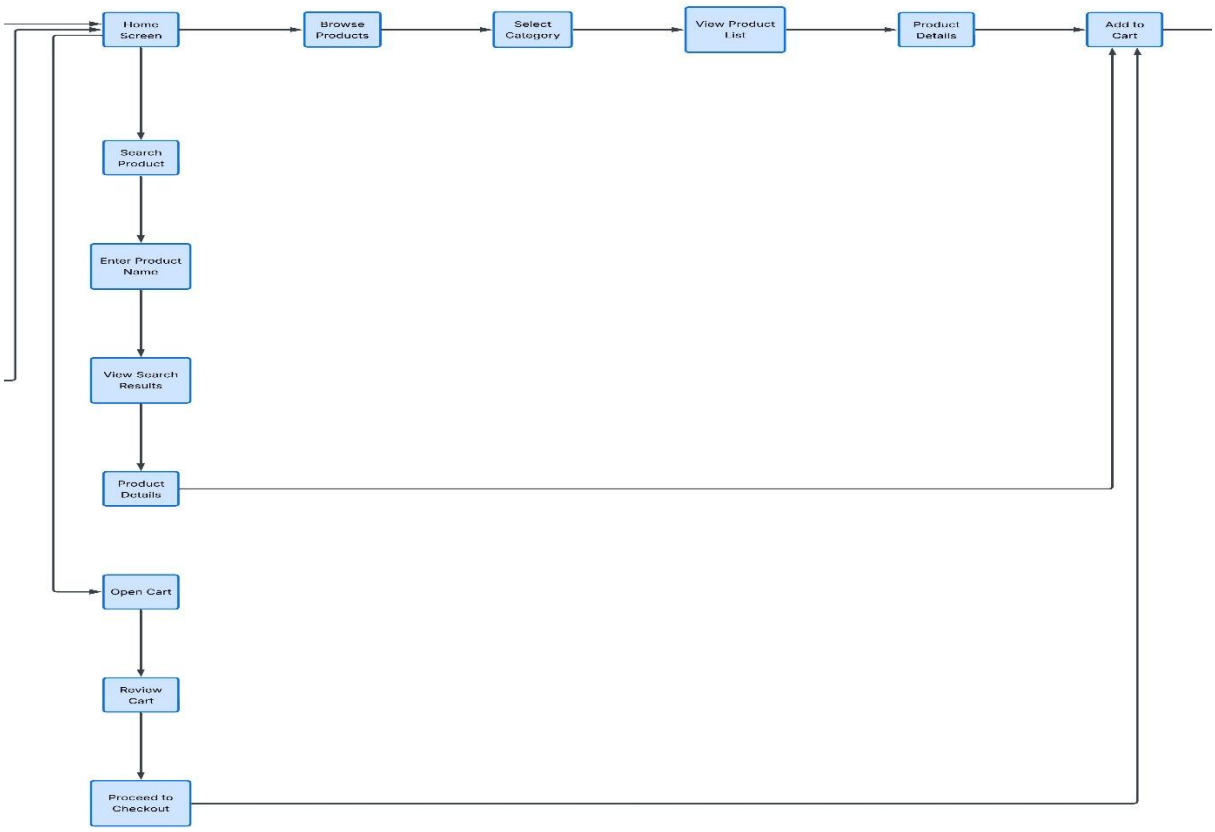
User Flow is a visual representation of the path users take to complete a task within an application.

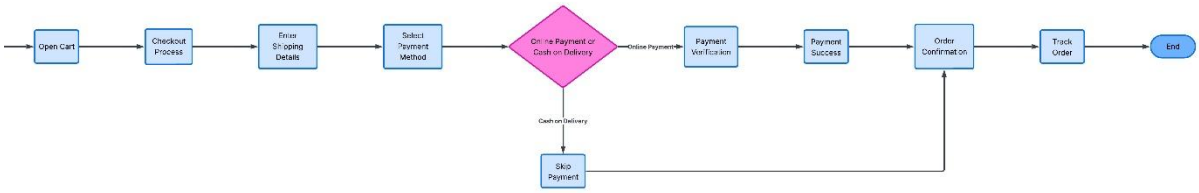
In this design, the user flow represents the **complete process of purchasing a product in an e-commerce application from start to end**.



User Flow for E-Commerce Shopping System

Start → Open App → Login/Register → Enter Username & Password → Login Successful → Home Screen → Browse Products → Select Category → View Product List → View Product Details → Add to Cart → Open Cart → Checkout Process → Enter Shipping Details → Select Payment Method → Payment Verification → Payment Success → Order Confirmation → Track Order → End





Step-by-Step Explanation of My Flowchart

Step 1: Start
• The user opens the e-commerce application.

Step 2: Login or Register
• If the user already has an account, they log in.
• If the user is new, they must register before continuing.

Step 3: Home Screen
• After successful login, the user is redirected to the home screen.
• The user can browse products or search for specific items.

Step 4: Browse or Search Products
• The user selects a product category or searches for a product.
• The system displays a list of available products.

Step 5: View Product Details
• The user clicks on a product to view details such as:
• Product description
• Price
• Images
• Specifications

Step 6: Add to Cart
• If the user wants to purchase the product, they add it to the shopping cart.
• The cart stores selected products for checkout.

Step 7: Open Cart and Review
• The user opens the cart to review selected items.
• They can check quantity and product details.

Step 8: Proceed to Checkout
• If everything is correct, the user proceeds to checkout.

Step 9: Enter Shipping Details
• The user enters delivery information such as:
• Address
• Phone number
• Delivery preferences

Step 10: Payment Method Decision
• The user selects a payment method:
• Online Payment
• Cash on Delivery (COD)

Step 11: Payment Verification (Online Payment Only)
• If online payment is selected, the system verifies the payment transaction.
• After verification, the payment is confirmed.

Step 12: Order Confirmation
• The order is successfully placed.
• The system displays an order confirmation message.

Step 13: Track Order
• The user can track the order status through the application.

Step 14: End
• The shopping process is completed successfully.

Decision Points in My Flowchart
• Login / Register decision
• Add to Cart decision
• Payment Method decision
• Payment Verification decision
These decision nodes allow flexible navigation and ensure smooth user interaction within the e-commerce system.

Result
The task analysis and user flow diagram were successfully created for the e-commerce application. The diagram clearly shows the sequence of steps and decision points involved in the online shopping process, from opening the application to tracking the order.
