EXPERIMENT - 06

Aim

To simulate the lifecycle stages of UI design using the RAD (Rapid Application Development) model and develop an interactive prototype.

Introduction

RAD (Rapid Application Development) is a software development model that focuses on fast development and continuous user feedback. Instead of long planning, it emphasizes building prototypes quickly and improving them through iterations.

It is mainly used for UI/UX-based applications like web and mobile apps where user experience is important.

Phases of RAD Model

Phase 1: Requirements Planning

In this phase, the system requirements and user needs are identified.

- Identify key features like:
  Home, Categories, Product Listing, Product Details, Cart, Checkout, Order Confirmation
- Identify user actions such as:
  Searching, Browsing, Adding to cart, Payment, Tracking orders

This phase helps define what the application should do.

Phase 2: User Design

In this phase, UI screens and wireframes are created using tools like Axure or Figma.

- Designed screens include:
  - Home Page (products display)
  - Categories Page
  - Product Listing Page
  - Product Details Page
  - Cart and Checkout Page
  - Order Confirmation Page

As shown in your images:

- Home screen with product cards
- Category selection (Men, Women, Shoes)
- Product listing (Men Casuals)
- Product detail with Buy/Add to Cart
- Order success screen

These designs help visualize how the app will look and work.

Phase 3: Construction

In this phase, interactive prototypes are developed.

- Navigation between screens is created
- Buttons like “Add to Cart”, “Buy Now” are made functional
- User flow is implemented:
  Home → Category → Product → Cart → Checkout → Order Confirmation
- Testing is done and changes are made based on feedback

This phase ensures the application works properly.

Phase 4: Cutover

This is the final phase where the system is completed and ready for use.

- Final prototype is prepared
- Design is shared with developers
- Documentation is created
- User guidance or training is provided

Result

The RAD model helps in developing UI quickly with continuous improvements. The designed prototype clearly shows the complete user flow of an e-commerce application, improving usability and user experience.
